

ORTHOPÆDIC APPARATUS.

THE BUTLER WALKING CHAIR.

This apparatus is designed for young children or infants who are learning to walk, but require support for the spine.

It is supplied with adjustable crutches and spinal support, has adjustable seat, so the patient can sit if desired. Swivel castors allow the stand to move in any direction.

Price on application.

DR. CASE'S IMPROVED WHEEL CRUTCH.

The apparatus devised by Dr. Case applies to the treatment of spine disease the principle of extension, already well established as a most efficient method for the cure of diseases of the joints. With this it combines the additional requirements in spinal cases: Relief from the weight of the head and shoulders (without casting the burden on some other part of the body); the straightening of the curves, (by means of the traction exerted by the weight of the body itself); and opportunity for exercise without restraint under the most favorable conditions.

All this is accomplished without the use of any rigid appliance attached to the person, and the discomfort and annoyance of such attachments are avoided. The results of daily exercise in this apparatus are simply marvelous. The patient improves rapidly in strength and height, the muscles concerned in maintaining an erect position are developed and invigorated, and a few weeks will frequently show a greater gain than can possibly be reached by months of restrictive treatment with the appliances formerly in use. Every source of danger and suffering is removed, and activity and pleasure take the place of monotony and pain.

Price and direction for measurement sent upon application.
