EDEBOHLS' OPERATING TABLE AS MODIFIED BY MAX WOCHER & SON,

MAKING IT APPLICABLE FOR GENERAL SURGERY.

The Edebohls' Operating Table was originally made for Gynaecological purposes and abdominal surgery, and did not answer the purpose of the general surgeon. To remedy this defect Dr. Morris modified the original by attaching a straight elongation in addition to the Trendelenburg section. This necessitated two detachable parts or sections composed of heavy iron and glass, making it impracticable and inconvenient to change, especially when patient was in position on the table, as one section had to be removed before the other could be attached.

The advantage offered by our table lies in the feature that without removing one part and inserting another, but by simple adjustment, it can be brought from the horizontal to the Trendelenburg position and vice versa, even if patient is on the table, by automatically catching in either position.

An adjustable side platform can be attached on either side at any part of the table for arm or leg operation or for instrument table, also can be attached on end of table for extension making full length of table with extension 80 inches.

For Gynaecological examinations, Lithotomy and Rectal Surgery the upright removable stirrups with foot straps are found of great service. The operating end of our table is made with solid legs supplied with rubber tips while the distal end has castors for conveniently shifting the table.

The facilities for rapid interchange between the Laparotomy, Lithotomy and Surgical position renders the table especially serviceable in the performance of Combined Operations.

Price of the Edebohls' Table as made by Max Wocher & Son, . \$60 00
