

EYE INSTRUMENTS.

4404a Test Type Illuminator (Ray's).

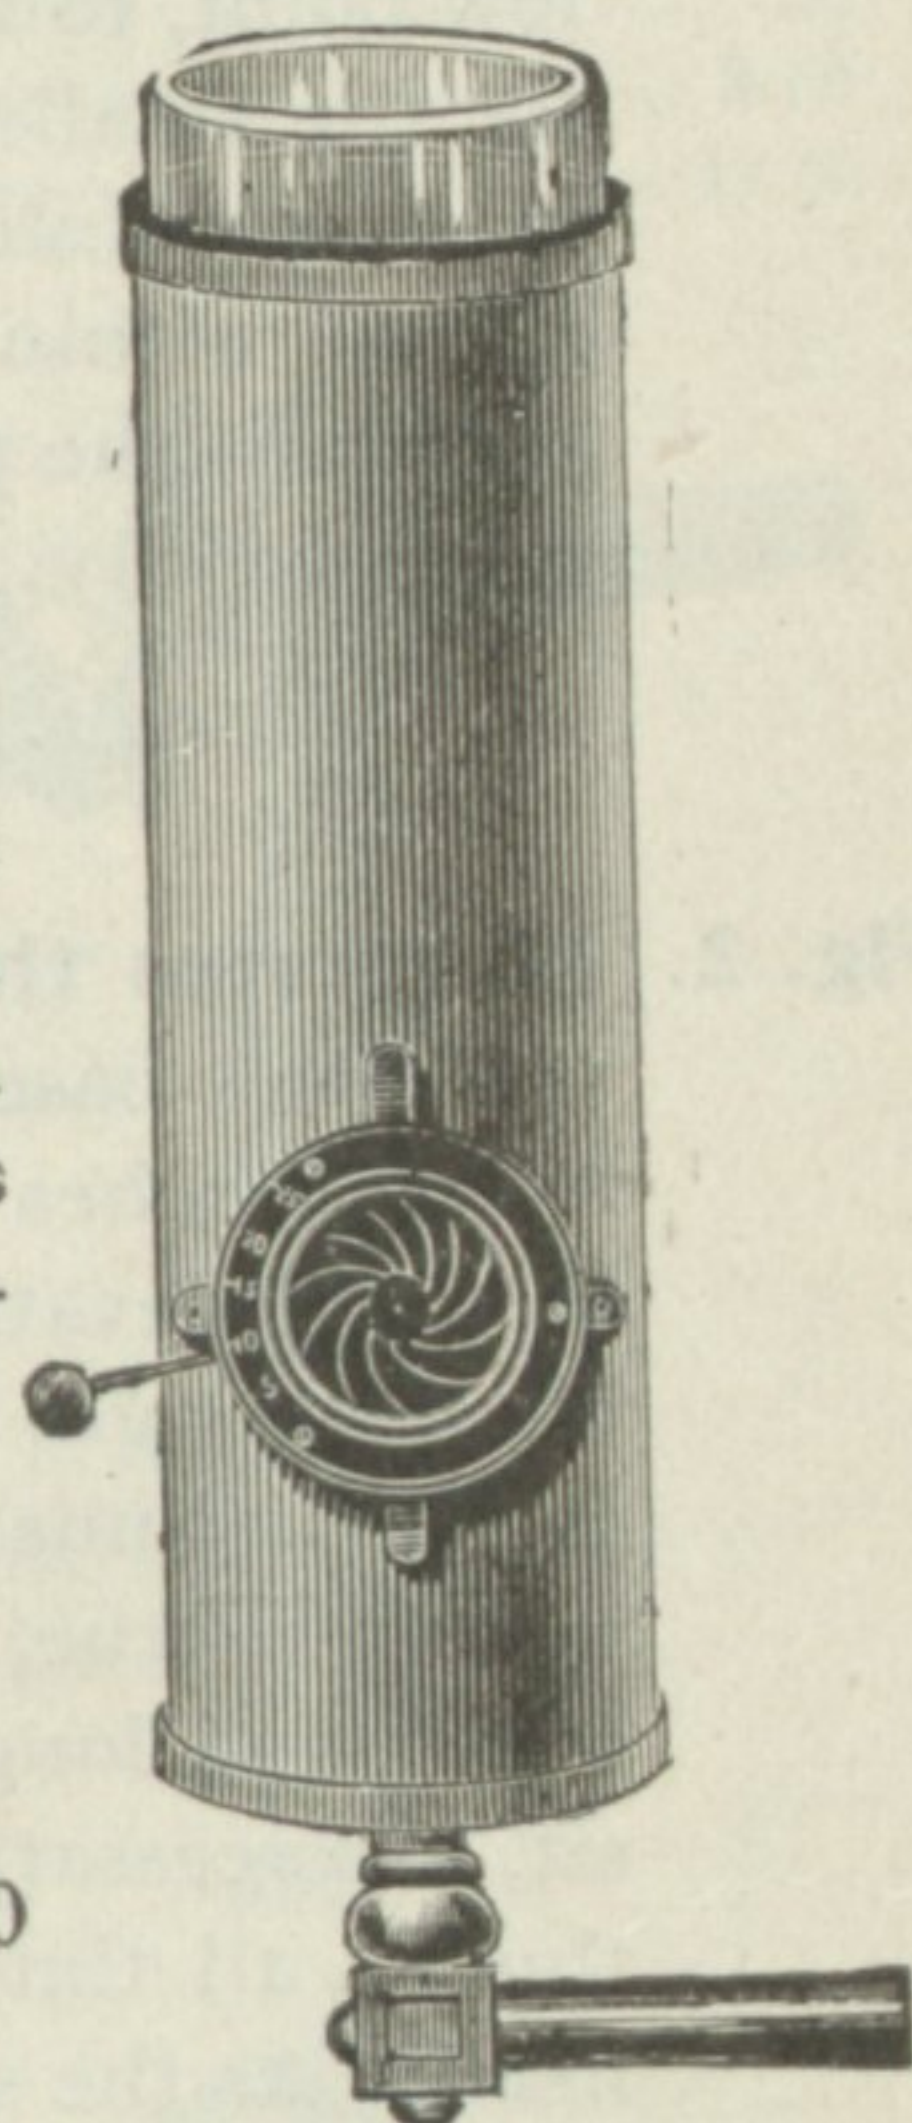

4404a

This apparatus has proven an indispensable article in every oculist's office. It is made of ivory-black wood finish, with metal reflectors, containing six four-candle-power electric lamps, giving perfect and uniform illumination on the cards. A double switch is furnished, one on either side of the bottom of the board, whereby the card can be illuminated independent of the small illuminated box at the bottom of the test card. This illuminated box has two slides, figure A showing the large astigmatic cross. When a small astigmatic cross is desired, figure B, which is fitted with an iris diaphragm, is placed over figure A, whereby astigmatic cross can be regulated in size. Figure C shows iris diaphragm closed, which, when used without section A, a circular light of various sizes can be obtained.

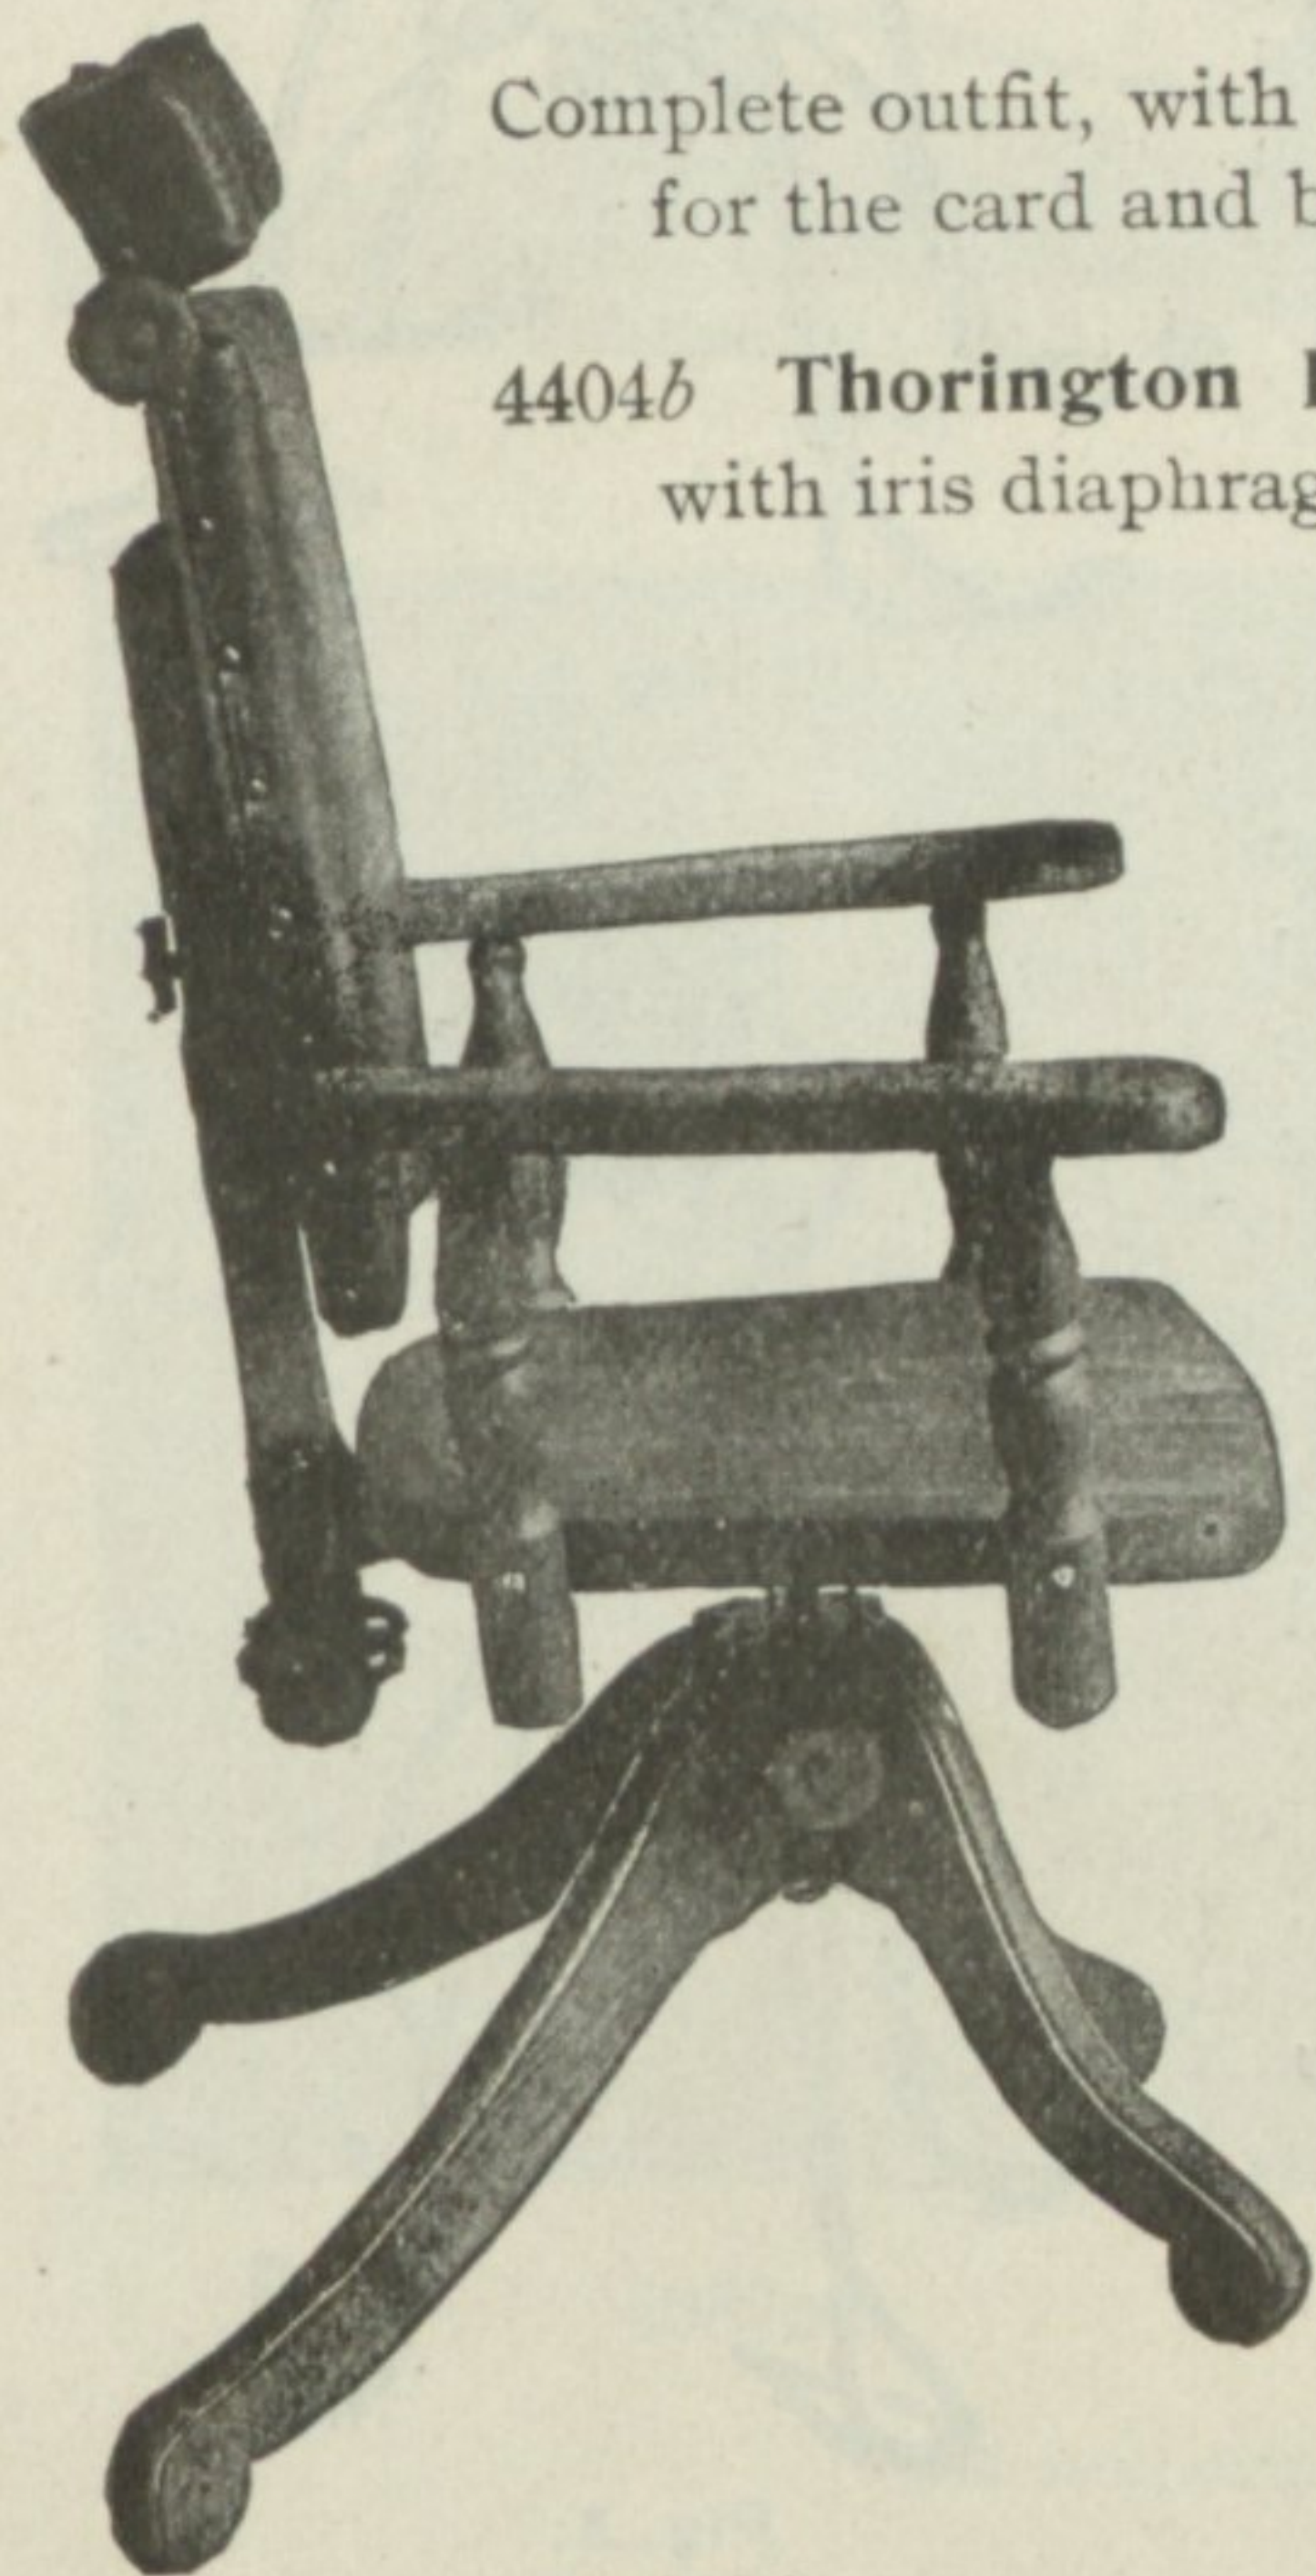

Color test glasses can be attached to clips on iris diaphragm.

4404c Chappell's Improved Operating Chair, with Arm Rests.

This Operating Chair has been designed by Dr. Chappell for the use of Nose and Throat Specialists. The chair has a revolving, raising and lowering seat, made of hardwood, and an upholstered and leather-covered back, which can be moved backward and forward as well as elevated, giving a firm support for the back. The addition of the head-rest, which has an independent adjustment for three different positions, makes the chair particularly convenient for the use of Ear or Eye Specialists.
