VERTICAL TRANSVERSE BILATERAL SECTION No. 4

Posterior view. It exhibits an entire lack of symmetry between the nasal fossae and sinuses of the right and left sides. The inferior meatus of the right side is closed anteriorly by the deflected nasal septum and the "spur" upon it. In such cases as this inspissated mucous often collects and the outlet of the lachrymal duct may be interfered with. It also forms a nucleus for infectious matter and may be the cause of necrosis of this region.

The figures indicate—

- 1-Brain Case
- 2—Crista Galli
- 3—Frontal Sinus
- 4—Ethmoidal Cells
- 5—Right Maxillary Sinus
- 6--Spur on Nasal Septum
- 7—Left Maxillary Sinus
