THE NASAL CHAMBER SAGITTAL SECTION No. 4

This section shows a great portion of the outer wall of the nasal fossa. A portion of the ethmoid scrolls has been removed, exposing the frontal sinus, from which a wire is passed through the ostium frontale into the hiatus semilunaris. There is a second sinus immediately below the frontal which has a separate outlet into the hiatus in close relation to the outlet of the frontal sinus, through which another wire passes. The posterior ethmoidal cells are unusually large in this specimen. This specimen is not of typical form though some of its variations may be classed as common.

The figures indicate—

- Large Frontal Sinus with Wire Passing
 Down to Nose
- 2—Imcomplete Septum
- 3— Small Frontal Sinus Communicating with Nose
- 4—Posterior Ethmoidal Cells
- 5-Middle Ethmoidal Cells
- 6—Anterior Ethmoidal Cells
- 7—Hiatus Semilunaris
- 8—Sphenoidal Sinus
- 9-Inferior Turbinated Bone
