DEVELOPMENT OF THE EXTERNAL AUDITORY CANAL No. 1

This Stereogram is made from the side view of a skull of an embryo of about seven months. The mandible is suspended in the glenoid fossa, which is flat and shallow. The condyles are round and short. Posterior to the glenoid fossa the auditory ring is well shown, and upon it the tympanic membrane; upon it also the greater portion of the wall of the external auditory canal is built. There is but slight change from these conditions until sometime after birth.

The figures indicate—

- 1-Frontal Bone
- 2—Coronal Suture
- 3-Parietal Bone
- 4—Lambdoid Suture
- 5-Occipital Bone
- 6—Temporal Bone
- 7—Greater Wing of Sphenoid Bone
- 8—Fontanelle
- 9-Zygoma
- 10—Temporo-Mandibular Articulation
- 11-Auditory Ring
- 12-Mastoid Process
